N°133 SPECTRO-3 series

1. Color control of different components of a gear box

After the assembling of a gear box, the different components must be controlled in relation to the color. At this color sensors type **SPECTRO-3-30-POL** are used on the respective positions. The distance from the sensor to the respective surface of the object is approximately 30mm. As shown in the screenshots a proper detection of the components is possible.
